

PRO100 - professional & user friendly

PRO100 is a professional and effective software tool for 3d interior and furniture design, which has been created by woodworkers for woodworkers and is now used by designers, kitchen manufacturers and furniture specialists around the world.

PRO100 can be used in any type of company – from the smallest family business to large companies with sophisticated distribution chains. It is so user friendly that even computer novices can successfully use it.

PRO100 is a totally independent application and as such does not require an environment other than Microsoft Windows. No other CAD product is required and working with Pro100 is really quick, effective and easy to learn.

PRO100 can be used for the design of any types of furniture or interiors, including but not limited too:

- kitchens
- office furniture
- living rooms
- wardrobes
- fireplaces
- bathrooms

Your project can be seen in several different views including the 3d perspective. There are 5 modes of display:

- wire frame
- sketch
- colours
- textures
- full realistic visualisation

In each mode you can activate different effects:

- semi transparent
- contours
- shading

All changes are immediately recalculated in all modes of the programme, and at each stage of your design you can freely modify all modules, add or removes handles, shelves etc or the whole item. Change colours of the entire project or just a part of it all at a mouse click. PRO100 is the perfect tool to work with.

With the ability to design in any view, 3d, elevation or plan and quickly change between these views at one click of the mouse, the program allows for very easy placement and designing.

Because PRO100 is so easy to use we have a trial version available. This is the full version without the facility to save, print or obtain any reports; also the materials are of a lower quality image to keep the file small for easier downloading.

PROCentre has been created for the Australasian market to compliment and fully integrate with PRO100. This has also been created by cabinetmakers, for cabinetmakers and produces accurate production information, (cut lists, hardware lists, material lists etc) and costings, together with a proposal so that a company can obtain complete manufacturing information. With

the seamless incorporation of ARDIS optimisation software clients are able to gain accurate cutting patterns together with labels for manual cutting or even linking through to a computerised beam saw, streamlining the production process even further.

All client information is able to be stored in one place for easy access and customer management via TCM+++4000 a basic version is provided with all versions of Design2Cam software. TCM is a full company management program that allows you to keep all information in one place, whether it's email, letters, scanned documents, drawings, pictures etc. You can create reports, email campaigns, mail merge and even send SMS messages, all of which will be logged against each client so you know you have a full record of what is sent to the customer.
